# Image Inpainting

---

Simple task of filling in missing (masked) areas.

Can be used for image completion or image editing.

Requires a large receptive field when handling large masks.

# Fourier Transform

Changing the basis of signals (temporal  $\rightarrow$  frequency)

- Decompose a periodic signal into a weighted sum of sinusoidal signals.
- Red signal =  $1 \times \sin(\omega t) + 0.5 \times \sin(2\omega t) + 0.1 \times \sin(3\omega t) + \dots$

Inverse Fourier Transform is also a straight forward operation.

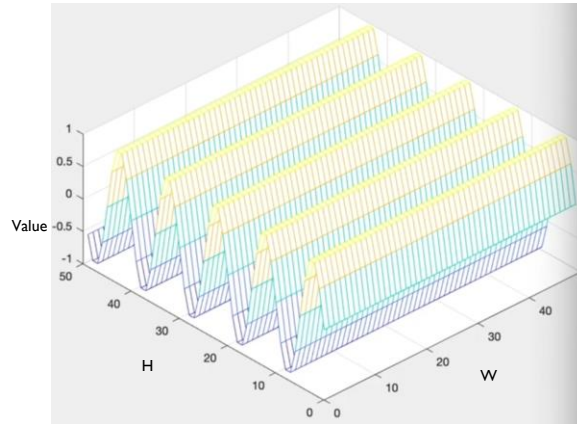

# Fourier Transform

Changing the basis of signals (spatial  $\rightarrow$  frequency)

- Extending to 2D signals (i.e., images)
- Summarize into a global information.

- Examples of 2D FFT

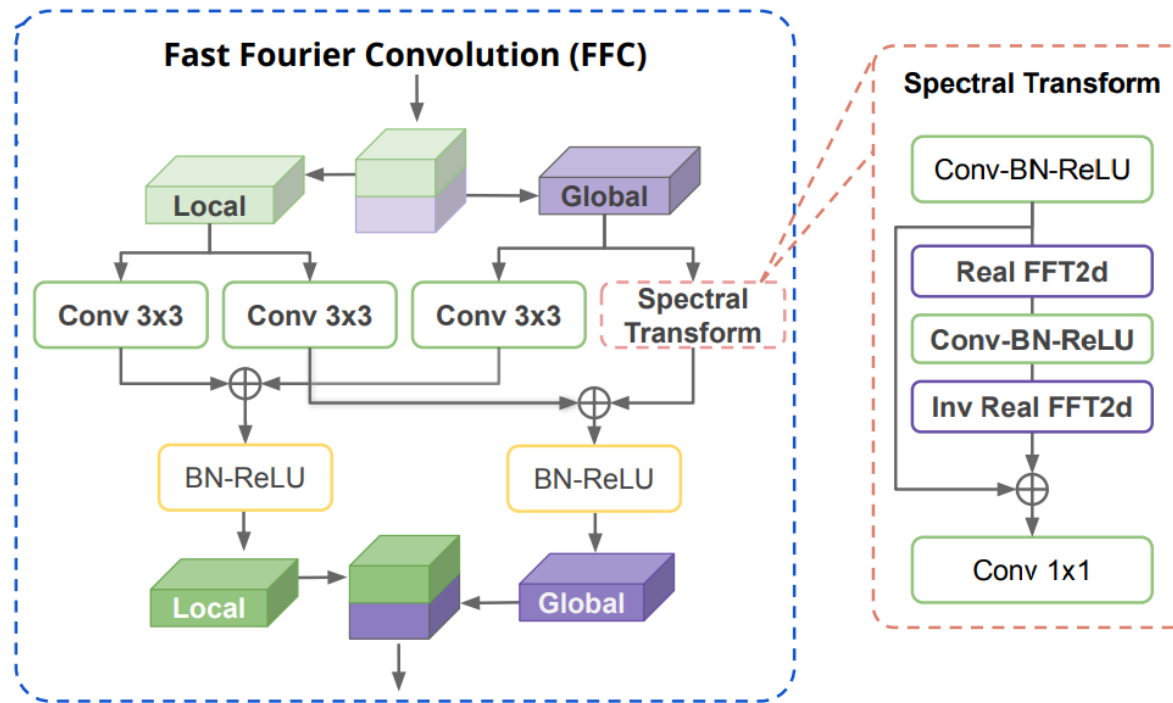

# Fast Fourier Convolution (FFC)

Pass convolution filters through features in the frequency domain.

- Effectively obtain a global receptive field.
- Frequency-wise control of features.

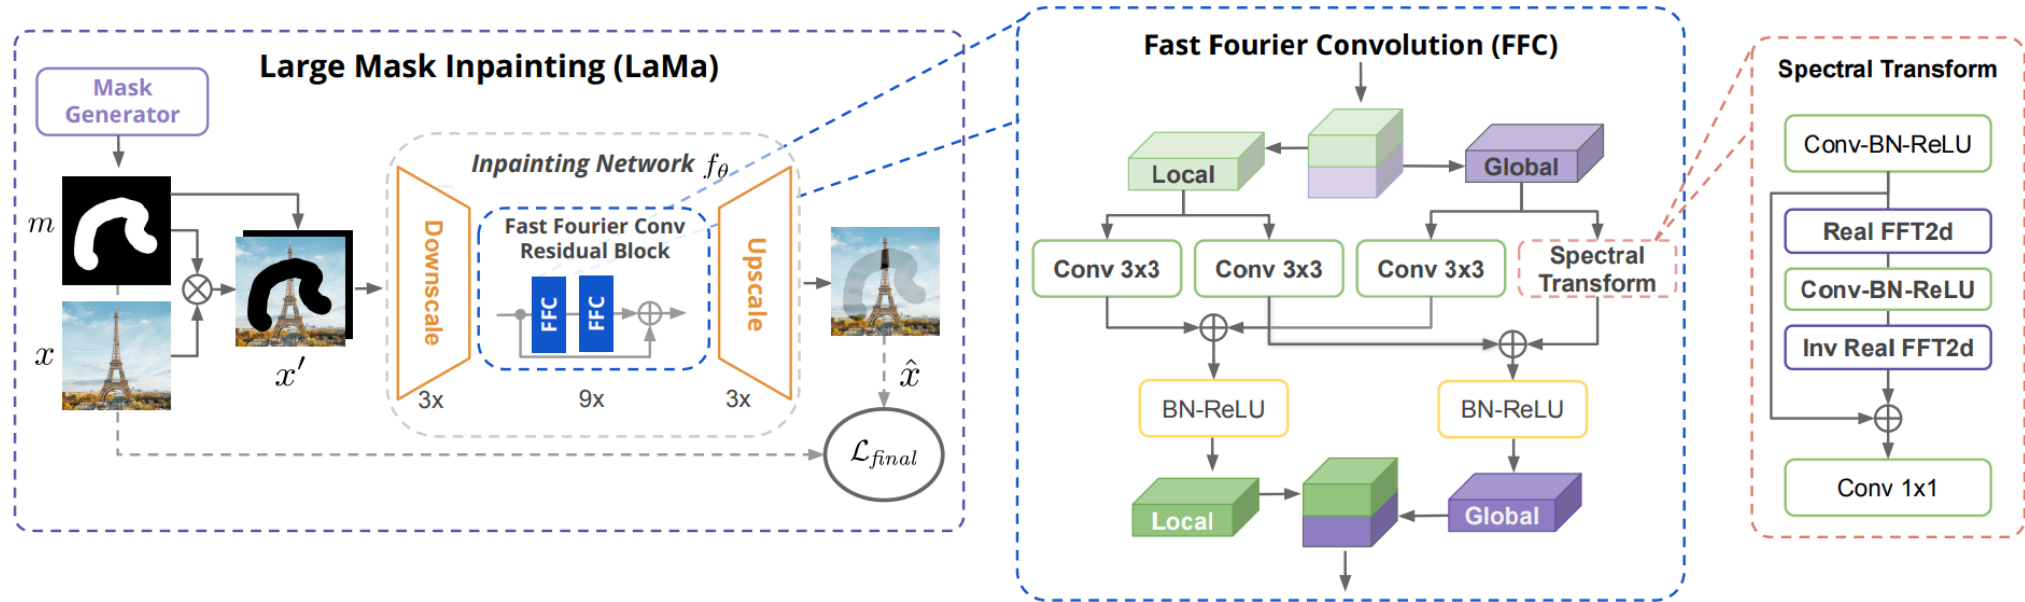

Internally exchange local and global features.

- Do not need to “wait” for local features to propagate to other regions.

# Large Mask Inpainting (LaMa)

Model architecture: Simple resblock-based architecture (e.g., MUNIT, FUNIT)

Loss function: 
$$\mathcal{L}_{final} = \kappa L_{Adv} + \underbrace{\alpha \mathcal{L}_{HRFPL}}_{\text{Perceptual loss}} + \underbrace{\beta \mathcal{L}_{DiscPL}}_{\text{Feature matching loss}} + \gamma R_1$$

High-receptive field Perceptual loss computed from a pre-trained ResNet

# Large Mask Inpainting (LaMa)

## Ablations Study

Model	Pretext Problem	Segmentation masks			
		Dilation	FID $\downarrow$	LPIPS $\downarrow$	
$\mathcal{L}_{HRFPL}$	RN50	Segm.	+	5.69	0.059
	RN50	Clf.	+	5.87 $\blacktriangle$ 3%	0.059
$\mathcal{L}_{CHIPL}$	RN50	Clf.	-	6.00 $\blacktriangle$ 5%	0.061 $\blacktriangle$ 3%
	VGG19	Clf.	-	6.29 $\blacktriangle$ 11%	0.063 $\blacktriangle$ 6%
$\mathcal{L}_{PL}$	-	-	-	6.46 $\blacktriangle$ 13%	0.065 $\blacktriangle$ 9%

Table 3: Comparison of LaMa-Regular trained with different perceptual losses. The  $\blacktriangle$  denotes deterioration, and  $\blacktriangledown$  denotes improvement of a score compared to the model trained with *HRF* perceptual loss based on segmentation ResNet50 with dilated convolutions (presented in the first row). Both dilated convolutions and pretext problem improved the scores.

Model	Convs	# Params	# Blocks	Narrow masks		Wide masks	
				FID $\downarrow$	LPIPS $\downarrow$	FID $\downarrow$	LPIPS $\downarrow$
Base	Fourier	27	9	0.63	0.090	2.21	0.135
Base	Dilated	46	9	0.66 $\blacktriangle$ 4%	0.089 $\blacktriangledown$ 1%	2.30 $\blacktriangle$ 4%	0.136 $\blacktriangle$ 1%
Base	Regular	46	9	0.60 $\blacktriangledown$ 5%	0.089 $\blacktriangledown$ 1%	3.51 $\blacktriangle$ 59%	0.139 $\blacktriangle$ 3%
Shallow	Fourier	19	6	0.72 $\blacktriangle$ 13%	0.094 $\blacktriangle$ 4%	2.31 $\blacktriangle$ 5%	0.138 $\blacktriangle$ 2%
Deep	Regular	74	15	0.63	0.090	2.62 $\blacktriangle$ 18%	0.137 $\blacktriangle$ 2%

Table 2: The table demonstrates performance of different LaMa architectures while leaving the other components the same. The  $\blacktriangle$  denotes deterioration, and  $\blacktriangledown$  denotes improvement compared to the Base-Fourier model (presented in the first row). The FFC-based models may sacrifice a little performance on narrow masks, but significantly outperform bigger models with regular convolutions on wide masks. Visually, the FFC-based models recover complex visual structures significantly better, as shown in Figure 4.
